SIZAATLAS Filling the Gaps for World Heritage

Table 1 - Moderation: Marana Co

The scope of SizaATLAS project is to address a comprehensive inventory of Siza's built works, and to develop a detailed documentation and analysis of the 18 buildings selected for the World Heritage List. This research and the comparison analysis with other contemporary architecture will result in a better understanding of the unique value of Siza's architecture, in a national and international context. This will be key to establish the justification of the Outstanding Universal Value (OUV) of his work, its national protection and an effective management system to support the instruction of Siza's works nomination for the World Heritage List. In a participatory based strategy, the inventory will have the collaboration of national and international organizations.
